Below are some practice questions for the first test. There will be questions on the actual test that do not resemble any of these questions. Other questions on the test may ask about similar material but be phrased in a different way. Still, doing all of these practice questions will help you prepare for the test.

1. Using the method of Theorem 1.25, give a DFA that recognizes the union of the languages recognized by the two DFAs given below. (You must use the method of Theorem 1.25, not the one of Theorem 1.45, which produces an NFA.)

2. Using the method from class, give an NFA that recognizes the concatenation of the language recognized by the first automaton below with the language recognized by the second automaton below:

3. Using the method from class, give a nondeterministic finite automaton that recognizes the star of the language recognized by the following NFA.
4. Let $N$ be the NFA given by

and let $M$ be the DFA equivalent to $N$ obtained by the method from class. Answer the following questions about $N$ and $M$. (Put your answers in the blank spaces.)

(a) Does $N$ accept the string $\varepsilon$? ________________
(b) Does $N$ accept the string $b$? ________________
(c) Does $N$ accept the string $ab$? ________________
(d) Does $N$ accept the string $abb$? ________________
(e) What is the start state of $M$? ________________
(f) Is $\emptyset$ an accept state or a reject state of $M$? ______
(g) Is $\{q_1, q_3\}$ an accept state or a reject state of $M$? ______
(h) What state does $M$ go to from state $\{q_0, q_1, q_3\}$ reading an $a$?

____________________

(i) What state does $M$ go to from state $\{q_0, q_1, q_3\}$ reading a $b$?

____________________
5. (a) Let $M$ be the NFA given below.

If you want to transform $M$ into an equivalent regular expression, you have to first modify $M$ into a GNFA $M'$ before you start eliminating states. Give the state diagram of this GNFA $M'$. (You are not being asked to eliminate any states. Just give the GNFA $M'$ that you first transform $M$ into.)

(b) Suppose that at some point while transforming an NFA into a regular expression you have the following GNFA.

Show the GNFA you would get from this one by eliminating state $r$. (You are not being asked to convert the GNFA into a regular expression. Just eliminate the state $r$.)

6. Convert the DFA given below into an equivalent right regular grammar.
7. Convert the right regular grammar given below into an equivalent NFA.

\[
\begin{align*}
S & \rightarrow bS \mid aT \\
T & \rightarrow bT \mid aU \varepsilon \\
U & \rightarrow bU \mid a
\end{align*}
\]

8. (a) Suppose that you are in the second step of putting a grammar into Chomsky normal form (eliminate \( \varepsilon \)-rules). You have already eliminated \( X \rightarrow \varepsilon \) and the current grammar is:

\[
\begin{align*}
S_0 & \rightarrow S \\
S & \rightarrow \varepsilon | SaS | SXY \\
X & \rightarrow YS | S | a \\
Y & \rightarrow SS | a
\end{align*}
\]

Show the grammar that you get by eliminating \( S \rightarrow \varepsilon \). (You are not being asked to eliminate all \( \varepsilon \)-rules, just \( S \rightarrow \varepsilon \).)

\[
\begin{align*}
S_0 & \rightarrow \text{(elaborate)} \\
S & \rightarrow \text{(elaborate)} \\
X & \rightarrow \text{(elaborate)} \\
Y & \rightarrow \text{(elaborate)}
\end{align*}
\]

(b) Suppose that you are in the third step of putting a grammar into Chomsky normal form (eliminate unit rules). You have already eliminated \( S \rightarrow V \) and the current grammar is:

\[
S_0 \rightarrow S
\]
Show the grammar that you get by eliminating $S \rightarrow U$. (You are not being asked to eliminate all unit rules, just $S \rightarrow U$.)

\[
\begin{align*}
S & \rightarrow aTb|U|VaV|b \\
U & \rightarrow aUb|V|W|a \\
V & \rightarrow VaV|b \\
W & \rightarrow ab
\end{align*}
\]

(c) Suppose that in the fourth and fifth steps of converting a grammar into Chomsky normal form, you have a rule $A \rightarrow BCab$. Show the collection of rules of the form $X \rightarrow YZ$ and $X \rightarrow c$ that you use to replace this one rule.

9. Let $G$ be the grammar

\[
\begin{align*}
S & \rightarrow aB|bA|\varepsilon \\
A & \rightarrow aS|bAA \\
B & \rightarrow aBB|bS
\end{align*}
\]

(We have discussed this grammar in class.)

(a) Give a leftmost derivation in $G$ for the string $bbaaab$.

(b) Using the method from class, give a PDA that recognizes the language generated by $G$.

10. Let $M$ be the PDA given by:

\[
\begin{align*}
0, \varepsilon & \rightarrow 0 \\
1, 0 & \rightarrow \varepsilon
\end{align*}
\]

(a) Does $M$ accept the string $\varepsilon$? 

(b) Does $M$ accept the string 01001? 

5
(c) Does $M$ accept the string 01101? 

(d) Describe in words the language recognized by $M$. 
    [Hint: You may find the concept of “prefix of a string” as given in Problem 1.32 of the text to be useful.]

(e) If you want to convert the PDA $M$ into a context-free grammar, then the first thing you have to do is transform $M$ into another PDA $M'$. Give this PDA $M'$. (You are not being asked to transform $M$ into a CFG. Just give the PDA $M'$.)

(f) Suppose you are converting a PDA into a CFG and the only moves in the PDA that involve the stack symbol 0 are the following:

\[
\begin{align*}
    & p \quad 0, \varepsilon \rightarrow 0 \\
    & r \quad \varepsilon, 0 \rightarrow \varepsilon \\
    & t \quad 1, 0 \rightarrow \varepsilon \\
    & v \quad \varepsilon, \varepsilon \rightarrow 0
\end{align*}
\]

The grammar will contain four rules corresponding to the different ways to push and pop a 0. What are these four rules?
11. Let \( P \) be the following PDA. (We discussed a PDA very similar to \( P \) in class. \( P \) recognizes the language \( \{ w \in \{a, b\}^* | w \) contains the same number of \( a \)'s and \( b \)'s}.)

(a) Show the accepting computation of \( P \) on the input string \( abba \) by filling in the chart below showing the state, tape contents and stack contents after each step. There are 10 steps in the computation and the initial state, tape and stack are filled in.

<table>
<thead>
<tr>
<th>State</th>
<th>Tape</th>
<th>Stack</th>
</tr>
</thead>
<tbody>
<tr>
<td>( q )</td>
<td>( abba )</td>
<td>( \varepsilon )</td>
</tr>
<tr>
<td>( \vdots )</td>
<td>( \vdots )</td>
<td>( \vdots )</td>
</tr>
</tbody>
</table>

(b) The PDA \( P \) is “special”. Let \( G \) be the grammar you obtain from \( P \) using the method of Lemma 2.27. Give a parse tree for the string \( abba \) in \( G \).

[You are not being asked to write out the whole grammar \( G \). You only have to give a parse tree for \( abba \). Even if you find this part hard, you should do Part (a), which should be easier.]
12. Classify each of the following languages as being i) regular, or ii) context-free but not regular, or iii) not context-free. Justify your answers.

(a) \( \{ w\#u \mid w, u \in \{0, 1\}^* \text{ and } |w| = |u| \} \)

(b) \( \{ w \in \{0, 1\}^* \mid w \text{ contains an odd number of } 0\text{'s and exactly one } 1 \} \)

(c) \( \{ w \in \{0, 1, 2\}^* \mid w \text{ contains more } 0\text{'s than } 1\text{'s and more } 0\text{'s than } 2\text{'s} \} \)
