# Ahmet A.

Team 8  |  CS 410  |  UMass Boston

- This project focuses on understanding how backend systems run on a server

- It introduces the concept of client-server architecture

- Uses Django as a backend framework to process requests and manage data

- Demonstrates how multiple users (clients) connect to a central server

- Explores testing server behavior using localhost (127.0.0.1)

- Highlights how server-side errors occur and how they can be debugged

## Research Question

*How does running a backend on a centralized server improve performance and scalability compared to running it locally?*
