## Representing Information

Representing Information

Two's complement method to compute $-x$ :

Representing Information

Two's complement method to compute $-x$ :
(1) Represent $x$ in binary

Representing Information

Two's complement method to compute $-x$ :
(1) Represent $x$ in binary
(2) Flip the bits of the result

Representing Information

Two's complement method to compute $-x$ :
(1) Represent $x$ in binary

2 Flip the bits of the result
3 Add 1 to the result

Two's complement method to compute $-x$ :
(1) Represent $x$ in binary
2) Flip the bits of the result

3 Add 1 to the result

Example (-3 on an 8-bit computer):

Two's complement method to compute $-x$ :
(1) Represent $x$ in binary
2) Flip the bits of the result

3 Add 1 to the result

Example (-3 on an 8-bit computer):

- Represent 3 in binary as 00000011

Two's complement method to compute $-x$ :
(1) Represent $x$ in binary
2) Flip the bits of the result

3 Add 1 to the result

Example (-3 on an 8-bit computer):

- Represent 3 in binary as 00000011
- Flip the bits of the result to obtain 11111100

Two's complement method to compute $-x$ :
(1) Represent $x$ in binary
2) Flip the bits of the result

3 Add 1 to the result

Example (-3 on an 8-bit computer):

- Represent 3 in binary as 00000011
- Flip the bits of the result to obtain 11111100
- Add 1 to the result to obtain 11111101

Two's complement method to compute $-x$ :
(1) Represent $x$ in binary
(2) Flip the bits of the result

3 Add 1 to the result

Example (-3 on an 8-bit computer):

- Represent 3 in binary as 00000011
- Flip the bits of the result to obtain 11111100
- Add 1 to the result to obtain 11111101

Note: just like how $3+(-3)=0$, we have $00000011+11111101=100000000$

## Representing Information

Assuming we only have 10 decimal digits to represent a real number, we might use:

Assuming we only have 10 decimal digits to represent a real number, we might use:

- The first digit for the sign ( 0 for + and 1 for - ) of the fractional part

Assuming we only have 10 decimal digits to represent a real number, we might use:

- The first digit for the sign ( 0 for + and 1 for - ) of the fractional part
- The next six digits for the fractional part

Assuming we only have 10 decimal digits to represent a real number, we might use:

- The first digit for the sign ( 0 for + and 1 for - ) of the fractional part
- The next six digits for the fractional part
- The eigth digit for the sign ( 0 for + and 1 for - ) of the exponent

Assuming we only have 10 decimal digits to represent a real number, we might use:

- The first digit for the sign ( 0 for + and 1 for - ) of the fractional part
- The next six digits for the fractional part
- The eigth digit for the sign ( 0 for + and 1 for - ) of the exponent
- The last two digits for the exponent

Assuming we only have 10 decimal digits to represent a real number, we might use:

- The first digit for the sign ( 0 for + and 1 for - ) of the fractional part
- The next six digits for the fractional part
- The eigth digit for the sign ( 0 for + and 1 for - ) of the exponent
- The last two digits for the exponent

Example: the 10-digit number 0314159001 represents $0.314159 \times 10^{1}=3.14159$

## Representing Information

ASCII (American Standard Code for Information Interchange) defines 8-bit encodings for letters and numbers in English, and a select set of special characters

ASCII (American Standard Code for Information Interchange) defines 8-bit encodings for letters and numbers in English, and a select set of special characters

Example: the numbers 65-90 encode upper-case letters A-Z, numbers $97-122$ encode lower-case letters a-z, and numbers 48-57 encode digits 0-9

ASCII (American Standard Code for Information Interchange) defines 8-bit encodings for letters and numbers in English, and a select set of special characters

Example: the numbers 65-90 encode upper-case letters A-Z, numbers $97-122$ encode lower-case letters a-z, and numbers 48-57 encode digits 0-9

The 16-bit Unicode system can represent every character in every known language, with room for more

## Representing Information

A string is represented as a sequence of numbers, with a "length field" at the very beginning specifying the length of the string

A string is represented as a sequence of numbers, with a "length field" at the very beginning specifying the length of the string

Example: the string "Python" is represented in decimal as the sequence

$$
006080121116104111110
$$

or in binary as the sequence
00000110010100000111100101110100011010000110111101101110

## Representing Information

Representing Information

We can represent any structured information as a sequence of numbers

We can represent any structured information as a sequence of numbers

Example (encoding pictures, sounds, and movies):

We can represent any structured information as a sequence of numbers

Example (encoding pictures, sounds, and movies):

- A picture as a sequence of triples, each containing the amount of red, green, and blue at a pixel

We can represent any structured information as a sequence of numbers

Example (encoding pictures, sounds, and movies):

- A picture as a sequence of triples, each containing the amount of red, green, and blue at a pixel
- A sound as a temporal sequence of "sound pressure levels"

We can represent any structured information as a sequence of numbers

Example (encoding pictures, sounds, and movies):

- A picture as a sequence of triples, each containing the amount of red, green, and blue at a pixel
- A sound as a temporal sequence of "sound pressure levels"
- A movie as a temporal sequence of pictures (usually 30 per second), along with a matching sound sequence

## Boolean Functions

研

A boolean variable is a variable that has the value 1 (True) or 0 (False)

A boolean variable is a variable that has the value 1 (True) or 0 (False)
A boolean function is an algebraic expression consisting of boolean variables and logical operations

A boolean variable is a variable that has the value 1 (True) or 0 (False)

A boolean function is an algebraic expression consisting of boolean variables and logical operations
The three basic boolean functions: $\operatorname{not}(x)=\bar{x}, o r(x, y)=x+y$, and $\operatorname{and}(x, y)=x \cdot y$

A boolean variable is a variable that has the value 1 (True) or 0 (False)
A boolean function is an algebraic expression consisting of boolean variables and logical operations
The three basic boolean functions: $\operatorname{not}(x)=\bar{x}, o r(x, y)=x+y$, and $\operatorname{and}(x, y)=x \cdot y$
The truth table for a boolean function is a listing of all possible combinations of values of the input variables, together with the result produced by the function

A boolean variable is a variable that has the value 1 (True) or 0 (False)
A boolean function is an algebraic expression consisting of boolean variables and logical operations
The three basic boolean functions: $\operatorname{not}(x)=\bar{x}, o r(x, y)=x+y$, and $\operatorname{and}(x, y)=x \cdot y$
The truth table for a boolean function is a listing of all possible combinations of values of the input variables, together with the result produced by the function

Truth tables for not, or, and and functions

| $x$ | $\bar{x}$ |
| :---: | :---: |
| 0 | 1 |
| 1 | 0 |

| $x$ | $y$ | $x+y$ |
| :---: | :---: | :---: |
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 1 |
| 1 | 1 | 1 |

| $x$ | $y$ | $x \cdot y$ |

3 For each remaining row, create a "minterm" as follows:
a. For each variable $x$ : if its value in that row is 1 , write $x$; otherwise, write $\bar{x}$
b. Combine all of the variables using .
4) Combine all of the minterms using +

## Boolean Functions

研

Example (implication function): consider the proposition "if you score over $93 \%$ in this course, then you will get an A"
The proposition is described by the implication function $(x \Longrightarrow y)$

| $x$ | $y$ | $x \Longrightarrow y$ | minterm |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 |  |
| 0 | 1 | 1 |  |
| 1 | 0 | 0 |  |
| 1 | 1 | 1 |  |

Example (implication function): consider the proposition "if you score over $93 \%$ in this course, then you will get an A"
The proposition is described by the implication function $(x \Longrightarrow y)$

| $x$ | $y$ | $x \Longrightarrow y$ | minterm |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 |  |
| 0 | 1 | 1 |  |
| 1 | 0 | 0 |  |
| 1 | 1 | 1 |  |

Example (implication function): consider the proposition "if you score over $93 \%$ in this course, then you will get an A"
The proposition is described by the implication function $(x \Longrightarrow y)$

| $x$ | $y$ | $x \Longrightarrow y$ | minterm |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | $\bar{x} \cdot \bar{y}$ |
| 0 | 1 | 1 |  |
| 1 | 0 | 0 |  |
| 1 | 1 | 1 |  |

Example (implication function): consider the proposition "if you score over $93 \%$ in this course, then you will get an A"
The proposition is described by the implication function $(x \Longrightarrow y)$

| $x$ | $y$ | $x \Longrightarrow y$ | minterm |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | $\bar{x} \cdot \bar{y}$ |
| 0 | 1 | 1 | $\bar{x} \cdot y$ |
| 1 | 0 | 0 |  |
| 1 | 1 | 1 |  |

Example (implication function): consider the proposition "if you score over $93 \%$ in this course, then you will get an A"
The proposition is described by the implication function $(x \Longrightarrow y)$

| $x$ | $y$ | $x \Longrightarrow y$ | minterm |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | $\bar{x} \cdot \bar{y}$ |
| 0 | 1 | 1 | $\bar{x} \cdot y$ |
| 1 | 0 | 0 |  |
| 1 | 1 | 1 | $x \cdot y$ |

Example (implication function): consider the proposition "if you score over $93 \%$ in this course, then you will get an A"
The proposition is described by the implication function $(x \Longrightarrow y)$

| $x$ | $y$ | $x \Longrightarrow y$ | minterm |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | $\bar{x} \cdot \bar{y}$ |
| 0 | 1 | 1 | $\bar{x} \cdot y$ |
| 1 | 0 | 0 |  |
| 1 | 1 | 1 | $x \cdot y$ |

Ergo, $\operatorname{implication}(x, y)=\bar{x} \cdot \bar{y}+\bar{x} \cdot y+x \cdot y$

A 1-bit memory circuit, called a latch, built using two nor gates

## Logic Circuits

Truth table for a nor gate (or followed by not)

| $x$ | $y$ | $\overline{x+y}$ |
| :---: | :---: | :---: |
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 0 |

A 1-bit memory circuit, called a latch, built using two nor gates

## Logic Circuits

Truth table for a nor gate (or followed by not)

| $x$ | $y$ | $\overline{x+y}$ |
| :---: | :---: | :---: |
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 0 |

A 1-bit memory circuit, called a latch, built using two nor gates

## Logic Circuits

Truth table for a nor gate (or followed by not)

| $x$ | $y$ | $\overline{x+y}$ |
| :---: | :---: | :---: |
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 0 |

A 1-bit memory circuit, called a latch, built using two nor gates

## Logic Circuits

Truth table for a nor gate (or followed by not)

| $x$ | $y$ | $\overline{x+y}$ |
| :---: | :---: | :---: |
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 0 |

A 1-bit memory circuit, called a latch, built using two nor gates

## Logic Circuits

Truth table for a nor gate (or followed by not)

| $x$ | $y$ | $\overline{x+y}$ |
| :---: | :---: | :---: |
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 0 |

A 1-bit memory circuit, called a latch, built using two nor gates

## Logic Circuits

Truth table for a nor gate (or followed by not)

| $x$ | $y$ | $\overline{x+y}$ |
| :---: | :---: | :---: |
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 0 |

A 1-bit memory circuit, called a latch, built using two nor gates

## Logic Circuits

Truth table for a nor gate (or followed by not)

| $x$ | $y$ | $\overline{x+y}$ |
| :---: | :---: | :---: |
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 0 |

A 1-bit memory circuit, called a latch, built using two nor gates

A billion latches can be combined together to produce a 1GB Random Access Memory (RAM) module

## Von Neumann Architecture

In a modern computer, the Central Processing Unit (CPU) is where all computation takes place

In a modern computer, the Central Processing Unit (CPU) is where all computation takes place

The CPU has devices such as ripple-carry adders for doing arithmetic, and a small amount of (scratch) memory called registers

In a modern computer, the Central Processing Unit (CPU) is where all computation takes place

The CPU has devices such as ripple-carry adders for doing arithmetic, and a small amount of (scratch) memory called registers

The computer's main memory is separate from the CPU but connected to it by wires

In a modern computer, the Central Processing Unit (CPU) is where all computation takes place

The computer's main memory is separate from the CPU but connected to it by wires

A program, which is a long list of instructions, is stored in main memory and executed in the CPU, one instruction at a time

The CPU has two special registers:
(1) A program counter to track the next instruction to execute
2. An instruction register to store the next instruction for execution

## Von Neumann Architecture

Example: an 8-bit computer with four operations (add, subtract, multiply, and divide), four registers ( 0 through 3), and 256 8-bit memory cells

Memory

| 00000000 | 0 | $\square$ |
| ---: | ---: | ---: |
| 00000001 | 1 | $\square$ |
| 00000010 | 2 | $\square$ |
| 00000011 | 3 | $\square$ |
| 00000100 | 4 | $\square$ |
|  | $\ldots$ | $\square$ |
| 11111110 | 254 | $\square$ |
|  | $\square 111111$ | 255 |

## Von Neumann Architecture

## Von Neumann Architecture

Instructions, like data, can be encoded as numbers

## Von Neumann Architecture

Instructions, like data, can be encoded as numbers

Example (our 8-bit computer revisited):

Instructions, like data, can be encoded as numbers

Example (our 8-bit computer revisited):

- 2-bit operation encodings: add (00); subtract (01); multiply (10); divide (11)

Instructions, like data, can be encoded as numbers

Example (our 8-bit computer revisited):

- 2-bit operation encodings: add (00); subtract (01); multiply (10); divide (11)
- 2-bit register encodings: register 0 (00); register 1 (01); register 2 (10); register 3 (11)

Instructions, like data, can be encoded as numbers

Example (our 8-bit computer revisited):

- 2-bit operation encodings: add (00); subtract (01); multiply (10); divide (11)
- 2-bit register encodings: register 0 (00); register 1 (01); register 2 (10); register 3 (11)
- 8-bit instruction encoding: first two bits for the operation; next two bits for the result register; last four bits for the two input registers

Instructions, like data, can be encoded as numbers

Example (our 8-bit computer revisited):

- 2-bit operation encodings: add (00); subtract (01); multiply (10); divide (11)
- 2-bit register encodings: register 0 (00); register 1 (01); register 2 (10); register 3 (11)
- 8-bit instruction encoding: first two bits for the operation; next two bits for the result register; last four bits for the two input registers
- An assembly language program for computing the square of the sum of the values in registers 0 and 1 , and storing the result in register 3

```
add 2 0 1
mul 3 2 2
```

Instructions, like data, can be encoded as numbers

Example (our 8-bit computer revisited):

- 2-bit operation encodings: add (00); subtract (01); multiply (10); divide (11)
- 2-bit register encodings: register 0 (00); register 1 (01); register 2 (10); register 3 (11)
- 8-bit instruction encoding: first two bits for the operation; next two bits for the result register; last four bits for the two input registers
- An assembly language program for computing the square of the sum of the values in registers 0 and 1 , and storing the result in register 3

```
add 2 0 1
mul 3 2 2
```

and the equivalent machine language program

```
00 10 00 01
10}1011\quad10\quad1
```
