This document describes[1] the Application Programming Interface (API) for the data structures and algorithms discussed in the book *Algorithms* by Robert Sedgewick and Kevin Wayne. The corresponding libraries and data types are part of a package called `dsa`.

Fundamentals

Point2D implements Comparable<Point2D>	
`Point2D(double x, double y)`	constructs a point `(x, y)`
`double x()`	returns the x-coordinate of this point
`double y()`	returns the y-coordinate of this point
`double r()`	returns the polar radius of this point
`double theta()`	returns the polar angle $(-\pi, \pi)$ of this point
`double distanceTo(Point2D other)`	returns the Euclidean distance between this point and `other`
`double distanceSquaredTo(Point2D other)`	returns the squared Euclidean distance between this point and `other`
`boolean equals(Object other)`	returns `true` if this point and `other` have the same x- and y-coordinates, and `false` otherwise
`int hashCode()`	returns a hash code for this point
`String toString()`	returns a string representation of this point
`void draw()`	draws this point using standard draw
`void drawTo(Point2D other)`	draws a line between this point and `other` using standard draw
`int compareTo(Point2D other)`	returns a comparison of this point with `other` by their x- and y-coordinates
`Comparator<Point2D> atan2Order()`	returns a comparator for comparing two points by the atan2 angle $(-\pi, \pi)$ they make with this point
`Comparator<Point2D> polarOrder()`	returns a comparator for comparing two points by the polar angle $(0, 2\pi)$ they make with this point
`Comparator<Point2D> distanceOrder()`	returns a comparator for comparing two points by their distance to this point
`static Comparator<Point2D> xOrder()`	returns a comparator for comparing two points by their x-coordinate
`static Comparator<Point2D> yOrder()`	returns a comparator for comparing two points by their y-coordinate
`static Comparator<Point2D> rOrder()`	returns a comparator for comparing two points by their polar radius

RectHV	
`RectHV(double xMin, double yMin, double xMax, double yMax)`	constructs a rectangle `[xMin, yMin] x [xMax, yMax]`
`double xMin()`	returns the minimum x-coordinate of any point in this rectangle
`double yMin()`	returns the minimum y-coordinate of any point in this rectangle
`double xMax()`	returns the maximum x-coordinate of any point in this rectangle
`double yMax()`	returns the maximum y-coordinate of any point in this rectangle
`double width()`	returns the width of this rectangle
`double height()`	returns the height of this rectangle
`boolean intersects(RectHV other)`	returns `true` if this rectangle intersects `other`, and `false` otherwise
`boolean contains(Point2D p)`	returns `true` if this rectangle contains the point `p`, and `false` otherwise
`double distanceTo(Point2D p)`	returns the Euclidean distance between the point `p` and the closest point on this rectangle, and 0 if the point is within
`double distanceSquaredTo(Point2D p)`	returns the squared Euclidean distance between the point `p` and the closest point on this rectangle, and 0 if the point is within
`boolean equals(Object other)`	returns `true` if this rectangle and `other` have the same x- and y-bounds, and `false` otherwise
`int hashCode()`	returns a hash code for this rectangle
`String toString()`	returns a string representation of this rectangle
`void draw()`	draws this rectangle using standard draw

[1] A data type name in italics denotes an interface.

Vector	
`Vector(double[] coords)`	constructs a vector given its components
`double get(int i)`	returns the `i`th component of this vector
`Vector add(Vector other)`	returns the sum of this vector and `other`
`Vector subtract(Vector other)`	returns the difference of this vector and `other`
`double dot(Vector other)`	returns the dot product of this vector and `other`
`Vector scale(double alpha)`	returns a scaled (by factor `alpha`) copy of this vector
`Vector direction()`	returns a unit vector in the direction of this vector
`double magnitude()`	returns the magnitude of this vector
`int dimension()`	returns the dimension of this vector
`String toString()`	returns a string representation of this vector

Counter implements Comparable<Counter>	
`Counter(String id)`	constructs a counter given its id
`void increment()`	increments this counter by 1
`int tally()`	returns the current value of this counter
`void reset()`	resets this counter to zero
`boolean equals(Object other)`	returns `true` if this counter and `other` have the same tally, and `false` otherwise
`String toString()`	returns a string representation of this counter
`int compareTo(Counter other)`	returns a comparison of this counter with `other` by their tally

Date implements Comparable<Date>	
`Date(int month, int day, int year)`	constructs a date from `month`, `day`, and `year`
`Date(String s)`	constructs a date from a string `s` of the form "MM/DD/YYYY"
`int month()`	returns the month (an integer between 1 and 12)
`int day()`	returns the day (an integer between 1 and 31)
`int year()`	returns the year
`Date next()`	returns the next date in the calendar
`boolean isBefore(Date other)`	returns `true` if this date is before `other`, and `false` otherwise
`boolean isAfter(Date other)`	returns `true` if this date is after `other`, and `false` otherwise
`boolean equals(Object other)`	returns `true` if this date is the same as `other`, and `false` otherwise
`int hashCode()`	returns a hash code for this date
`String toString()`	returns a string representation of this date
`int compareTo(Date other)`	returns a chronological comparison of this date with `other`

Transaction implements Comparable<Transaction>	
`Transaction(String name, Date date, double amount)`	constructs a transaction from a `name`, `date`, and `amount`
`Transaction(String s)`	constructs a transaction from a string `s` of the form "name date amount"
`String name()`	returns the name of the person involved in this transaction
`Date date()`	returns the date of this transaction
`double amount()`	returns the amount of this transaction
`int hashCode()`	returns a hash code for this transaction
`String toString()`	returns a string representation of this transaction
`int compareTo(Transaction other)`	returns a comparison of this transaction with `other` by amount
`static Comparator<Transaction> nameOrder()`	returns a comparator for comparing two transactions by name
`static Comparator<Transaction> dateOrder()`	returns a comparator for comparing two transactions by date

LinearSearch

`static int indexOf(Object[] a, Object key)`	returns the index of `key` in the array `a`, or -1
`static int indexOf(int[] a, int key)`	returns the index of `key` in the array `a`, or -1
`static int indexOf(double[] a, double key)`	returns the index of `key` in the array `a`, or -1

BinarySearch

`static int indexOf(Comparable[] a, Comparable key)`	returns the index of `key` in the sorted array `a`, or -1
`static int indexOf(int[] a, int key)`	returns the index of `key` in the sorted array `a`, or -1
`static int indexOf(double[] a, double key)`	returns the index of `key` in the sorted array `a`, or -1

Bag<Item> extends Iterable<Item>

`boolean isEmpty()`	returns `true` if this bag is empty, and `false` otherwise
`int size()`	returns the number of items in this bag
`void add(Item item)`	adds `item` to this bag
`Iterator<Item> iterator()`	returns an iterator to iterate over the items in this bag

LinkedBag<Item> implements Bag<Item>

`LinkedBag()`	constructs an empty bag
`String toString()`	returns a string representation of this bag

ResizingArrayBag<Item> implements Bag<Item>

`ResizingArrayBag()`	constructs an empty bag
`String toString()`	returns a string representation of this bag

Queue<Item> extends Iterable<Item>

`boolean isEmpty()`	returns `true` if this queue is empty, and `false` otherwise
`int size()`	returns the number of items in this queue
`void enqueue(Item item)`	adds `item` to the end of this queue
`Item peek()`	returns the item at the front of this queue
`Item dequeue()`	removes and returns the item at the front of this queue
`Iterator<Item> iterator()`	returns an iterator to iterate over the items in this queue in FIFO order

LinkedQueue<Item> implements Queue<Item>

`LinkedQueue()`	constructs an empty queue
`String toString()`	returns a string representation of this queue

ResizingArrayQueue<Item> implements Queue<Item>

`ResizingArrayQueue()`	constructs an empty queue
`String toString()`	returns a string representation of this queue

Stack<Item> extends Iterable<Item>	
`boolean isEmpty()`	returns `true` if this stack is empty, and `false` otherwise
`int size()`	returns the number of items in this stack
`void push(Item item)`	adds `item` to the top of this stack
`Item peek()`	returns the item at the top of this stack
`Item pop()`	removes and returns the item at the top of this stack
`Iterator<Item> iterator()`	returns an iterator to iterate over the items in this stack in LIFO order

`LinkedStack<Item> implements Stack<Item>`	
`LinkedStack()`	constructs an empty stack
`String toString()`	returns a string representation of this stack

`ResizingArrayStack<Item> implements Stack<Item>`	
`ResizingArrayStack()`	constructs an empty stack
`String toString()`	returns a string representation of this stack

UF	
`int find(int p)`	returns the canonical site of the component containing site `p`
`int count()`	returns the number of components
`boolean connected(int p, int q)`	returns `true` if sites `p` and `q` belong to the same component, and `false` otherwise
`void union(int p, int q)`	connects sites `p` and `q` if they are not already connected

`QuickFindUF implements UF`	
`QuickFindUF(int n)`	constructs an empty union-find data structure with `n` sites

`QuickUnionUF implements UF`	
`QuickUnionUF(int n)`	constructs an empty union-find data structure with `n` sites

`WeightedQuickUnionUF implements UF`	
`WeightedQuickUnionUF(int n)`	constructs an empty union-find data structure with `n` sites

Sorting

`Bubble, Selection, Insertion, Shell, Merge, Quick, Quick3way, Heap`	
`static void sort(Comparable[] a)`	sorts the array `a` according to the natural order of its objects
`static void sort(Object[] a, Comparator c)`	sorts the array `a` according to the order induced by the comparator `c`
`static void sort(int[] a)`	sorts the array `a`
`static void sort(double[] a)`	sorts the array `a`

MinPQ<Key> implements Iterable<Key>	
`MinPQ()`	constructs an empty minPQ
`MinPQ(Comparator<Key> c)`	constructs an empty minPQ with the given comparator
`MinPQ(int capacity)`	constructs an empty minPQ with the given capacity
`MinPQ(int capacity, Comparator<Key> c)`	constructs an empty minPQ with the given capacity and comparator
`boolean isEmpty()`	returns `true` if this minPQ is empty, and `false` otherwise
`int size()`	returns the number of keys in this minPQ
`void insert(Key key)`	adds `key` to this minPQ
`Key min()`	returns the smallest key in this minPQ
`Key delMin()`	removes and returns the smallest key in this minPQ
`Iterator<Key> iterator()`	returns an iterator to iterate over the keys in this minPQ in ascending order
`String toString()`	returns a string representation of this minPQ

MaxPQ<Key> implements Iterable<Key>	
`MaxPQ()`	constructs an empty maxPQ
`MaxPQ(Comparator<Key> c)`	constructs an empty maxPQ with the given comparator
`MaxPQ(int capacity)`	constructs an empty maxPQ with the given capacity
`MaxPQ(int capacity, Comparator<Key> c)`	constructs an empty maxPQ with the given capacity and comparator
`boolean isEmpty()`	returns `true` if this maxPQ is empty, and `false` otherwise
`int size()`	returns the number of keys in this maxPQ
`void insert(Key key)`	adds `key` to this maxPQ
`Key max()`	returns the largest key in this maxPQ
`Key delMax()`	removes and returns the largest key in this maxPQ
`Iterator<Key> iterator()`	returns an iterator to iterate over the keys in this maxPQ in descending order
`String toString()`	returns a string representation of this maxPQ

IndexMinPQ<Key extends Comparable<Key>> implements Iterable<Key>	
`IndexMinPQ(int maxN)`	constructs an empty indexMinPQ with indices from the interval `[0, maxN)`
`boolean isEmpty()`	returns `true` if this indexMinPQ is empty, and `false` otherwise
`int size()`	returns the number of keys in this indexMinPQ
`void insert(int i, Key key)`	associates `key` with index `i` in this indexMinPQ
`void change(int i, Key key)`	changes the key associated with index `i` to `key` in this indexMinPQ
`boolean contains(int i)`	returns `true` if `i` is an index in this indexMinPQ, and `false` otherwise
`int minIndex()`	returns the index associated with the smallest key in this indexMinPQ
`Key minKey()`	returns the smallest key in this indexMinPQ
`Key keyOf(int i)`	returns the key associated with index `i` in this indexMinPQ
`int delMin()`	removes the smallest key from this indexMinPQ and returns its associated index
`void delete(int i)`	removes the key associated with index `i` in this indexMinPQ
`Iterator<Integer> iterator()`	returns an iterator to iterate over the indices in this indexMinPQ in ascending order of the associated keys
`String toString()`	returns a string representation of this indexMinPQ

IndexMaxPQ<Key extends Comparable<Key>> implements Iterable<Key>	
`IndexMaxPQ(int maxN)`	constructs an empty indexMaxPQ with indices from the interval `[0, maxN)`
`boolean isEmpty()`	returns `true` if this indexMaxPQ is empty, and `false` otherwise
`int size()`	returns the number of keys in this indexMaxPQ
`void insert(int i, Key key)`	associates `key` with index `i` in this indexMaxPQ
`void change(int i, Key key)`	changes the key associated with index `i` to `key` in this indexMaxPQ
`boolean contains(int i)`	returns `true` if `i` is an index in this indexMaxPQ, and `false` otherwise
`int maxIndex()`	returns the index associated with the largest key in this indexMaxPQ
`Key maxKey()`	returns the largest key in this indexMaxPQ
`Key keyOf(int i)`	returns the key associated with index `i` in this indexMaxPQ
`int delMax()`	removes the largest key from this indexMaxPQ and returns its associated index
`void delete(int i)`	removes the key associated with index `i` in this indexMaxPQ
`Iterator<Integer> iterator()`	returns an iterator to iterate over the indices in this indexMaxPQ in descending order of the associated keys
`String toString()`	returns a string representation of this indexMaxPQ

Inversions	
`static long count(Comparable[] a)`	returns the number of inversions in the array `a` according to the natural order of its objects
`static long count(Object[] a, Comparator c)`	returns the number of inversions in the array `a` according to the order induced by the comparator `c`
`static long count(int a[])`	returns the number of inversions in the array `a`
`static long count(double a[])`	returns the number of inversions in the array `a`

Searching

BasicST<Key, Value>	
`boolean isEmpty()`	returns `true` if this symbol table is empty, and `false` otherwise
`int size()`	returns the number of key-value pairs in this symbol table
`void put(Key key, Value value)`	inserts the `key` and `value` pair into this symbol table
`Value get(Key key)`	returns the value associated with `key` in this symbol table, or `null`
`boolean contains(Key key)`	returns `true` if this symbol table contains `key`, and `false` otherwise
`void delete(Key key)`	deletes `key` and the associated value from this symbol table
`Iterable<Key> keys()`	returns all the keys in this symbol table

OrderedST<Key extends Comparable<Key>, Value>

`boolean isEmpty()`	returns `true` if this symbol table is empty, and `false` otherwise
`int size()`	returns the number of key-value pairs in this symbol table
`void put(Key key, Value value)`	inserts the `key` and `value` pair into this symbol table
`Value get(Key key)`	returns the value associated with `key` in this symbol table, or `null`
`boolean contains(Key key)`	returns `true` if this symbol table contains `key`, and `false` otherwise
`void delete(Key key)`	deletes `key` and the associated value from this symbol table
`Iterable<Key> keys()`	returns all the keys in this symbol table in sorted order
`Key min()`	returns the smallest key in this symbol table
`Key max()`	returns the largest key in this symbol table
`void deleteMin()`	deletes the smallest key and the associated value from this symbol table
`void deleteMax()`	deletes the largest key and the associated value from this symbol table
`Key floor(Key key)`	returns the largest key in this symbol table that is smaller than or equal to `key`
`Key ceiling(Key key)`	returns the smallest key in this symbol table that is greater than or equal to `key`
`int rank(Key key)`	returns the number of keys in this symbol table that are strictly smaller than `key`
`Key select(int k)`	returns the key in this symbol table with the rank `k`
`int size(Key lo, Key hi)`	returns the number of keys in this symbol table that are in the interval `[lo, hi]`
`Iterable<Key> keys(Key lo, Key hi)`	returns the keys in this symbol table that are in the interval `[lo, hi]` in sorted order

`LinearSearchST<Key, Value> implements BasicST<Key, Value>`

`LinearSearchST()`	constructs an empty symbol table
`String toString()`	returns a string representation of this symbol table

`BinarySearchST<Key extends Comparable<Key>, Value> implements OrderedST<Key, Value>`

`BinarySearchST()`	constructs an empty symbol table
`String toString()`	returns a string representation of this symbol table

`BinarySearchTreeST<Key extends Comparable<Key>, Value> implements OrderedST<Key, Value>`

`BinarySearchTreeST()`	constructs an empty symbol table
`Iterable<Key> preOrder()`	returns all the keys from this symbol table in pre-order
`Iterable<Key> inOrder()`	returns all the keys from this symbol table in in-order
`Iterable<Key> postOrder()`	returns all the keys from this symbol table in post-order
`String toString()`	returns a string representation of this symbol table

`RedBlackBinarySearchTreeST<Key extends Comparable<Key>, Value> implements OrderedST<Key, Value>`

`RedBlackBinarySearchTreeST()`	constructs an empty symbol table
`String toString()`	returns a string representation of this symbol table

`SeparateChainingHashST<Key, Value> implements BasicST<Key, Value>`

`SeparateChainingHashST()`	constructs an empty symbol table
`String toString()`	returns a string representation of this symbol table

Set<Key extends Comparable<Key>> implements Iterable<Key>	
`Set()`	constructs an empty set
`boolean isEmpty()`	returns `true` if this set is empty, and `false` otherwise
`int size()`	returns the number of keys in this set
`void add(Key key)`	adds `key` to this set, if it is not already present
`boolean contains(Key key)`	returns `true` if this set contains `key`, and `false` otherwise
`void delete(Key key)`	deletes `key` from this set
`Iterator<Key> iterator()`	returns an iterator to iterate over the keys in this set in sorted order
`String toString()`	returns a string representation of this set

SparseVector	
`SparseVector(int n)`	constructs an `n`-dimensional zero vector
`int dimension()`	returns the dimension of this vector
`int size()`	returns the number of nonzero entries in this vector
`void put(int i, double value)`	sets the `i`th component of this vector to `value`
`double get(int i)`	returns the `i`th component of this vector
`SparseVector plus(SparseVector other)`	returns the sum of this vector and `other`
`SparseVector scale(double alpha)`	returns the scalar-vector product of this vector and `alpha`
`double dot(SparseVector other)`	returns the dot product of this vector and `other`
`double magnitude()`	returns the magnitude of this vector
`String toString()`	returns a string representation of this vector

SparseMatrix	
`SparseMatrix(int m, int n)`	constructs an `m` x `n` dimensional zero matrix
`int nRows()`	returns the number of rows in this matrix
`int nCols()`	returns the number of columns in this matrix
`int size()`	returns the number of nonzero entries in this matrix
`void put(int i, int j, double value)`	sets the entry at row `i` and column `j` in this matrix to `value`
`double get(int i, int j)`	returns the entry in this matrix at row `i` and column `j`
`SparseMatrix plus(SparseMatrix other)`	returns the sum of this matrix and `other`
`SparseVector times(SparseVector x)`	returns the product of this matrix and the vector `x`
`String toString()`	returns a string representation of this matrix

Graphs

Graph	
`Graph(int V)`	constructs an empty graph with `V` vertices and 0 edges
`Graph(In in)`	constructs a graph from the input stream `in`
`int V()`	returns the number of vertices in this graph
`int E()`	returns the number of edges in this graph
`void addEdge(int v, int w)`	adds an undirected edge between vertices `v` and `w` in this graph
`Iterable<Integer> adj(int v)`	returns the vertices adjacent to vertex `v` in this graph
`int degree(int v)`	returns the degree of vertex `v` in this graph
`String toString()`	returns a string representation of this graph

Paths	
`boolean hasPathTo(int v)`	returns `true` if there is a path between a designated source vertex and vertex `v`, and `false` otherwise
`Iterable<Integer> pathTo(int v)`	returns a path between a designated source vertex and vertex `v`, or `null`
`double distTo(int v)`	returns the shortest distance between a designated source vertex and vertex `v`, or ∞

DFSPaths implements Paths	
`DFSPaths(Graph G, int s)`	computes paths between source vertex `s` and every other vertex in the graph `G`

BFSPaths implements Paths	
`BFSPaths(Graph G, int s)`	computes shortest paths between source vertex `s` and every other vertex in the graph `G`

SymbolGraph	
`SymbolGraph(In in, String delim)`	constructs a symbol graph from the input stream `in` and using `delim` as the delimiter
`boolean contains(String s)`	returns `true` if this symbol graph contains vertex `s`, and `false` otherwise
`int indexOf(String s)`	returns the integer associated with the vertex `s` in this symbol graph
`String nameOf(int v)`	returns the name of the vertex associated with the integer `v` in this symbol graph
`Graph graph()`	returns the graph associated with this symbol graph
`String toString()`	returns a string representation of this symbol graph

DiGraph	
`DiGraph(int V)`	constructs an empty digraph with `V` vertices and 0 edges
`DiGraph(In in)`	constructs a digraph from the input stream `in`
`int V()`	returns the number of vertices in this digraph
`int E()`	returns the number of edges in this digraph
`void addEdge(int v, int w)`	adds the directed edge `v->w` to this digraph
`Iterable<Integer> adj(int v)`	returns the vertices adjacent from vertex `v` in this digraph
`int outDegree(int v)`	returns the out-degree of vertex `v` in this digraph
`int inDegree(int v)`	returns the in-degree of vertex `v` in this digraph
`String toString()`	returns a string representation of this digraph

DFSDiPaths implements Paths	
`DFSDiPaths(DiGraph G, int s)`	computes paths from source vertex `s` to every other vertex in the digraph `G`

BFSDiPaths implements Paths	
`BFSDiPaths(DiGraph G, int s)`	computes shortest paths from source vertex `s` to every other vertex in the digraph `G`

SymbolDiGraph	
`SymbolDiGraph(In in, String delim)`	constructs a symbol digraph from the input stream `in` and using `delim` as the delimiter
`boolean contains(String s)`	returns `true` if this symbol digraph contains vertex `s`, and `false` otherwise
`int indexOf(String s)`	returns the integer associated with the vertex `s` in this symbol digraph
`String nameOf(int v)`	returns the name of the vertex associated with the integer `v` in this symbol digraph
`DiGraph diGraph()`	returns the digraph associated with this symbol digraph
`String toString()`	returns a string representation of this symbol digraph

DiCycle	
`DiCycle(DiGraph G)`	determines whether the digraph `G` has a directed cycle and, if so, finds such a cycle
`boolean hasCycle()`	returns `true` if a directed cycle was detected, and `false` otherwise
`Iterable<Integer> cycle()`	returns a directed cycle, or `null`

DFSOrders	
`DFSOrders(DiGraph G)`	determines depth-first orders (pre, post, and reverse post) for the digraph `G`
`int pre(int v)`	returns the pre-order number of vertex `v`
`int post(int v)`	returns the post-order number of vertex `v`
`Iterable<Integer> pre()`	returns the vertices in pre-order
`Iterable<Integer> post()`	returns the vertices in post-order
`Iterable<Integer> reversePost()`	returns the vertices in reverse post-order

Topological	
`Topological(DiGraph G)`	determines whether the digraph `G` has a topological order and, if so, finds such an order
`boolean hasOrder()`	returns `true` if there exists a topological order, and `false` otherwise
`Iterable<Integer> order()`	returns a topological order, or `null`

Edge implements Comparable<Edge>	
`Edge(int v, int w, double weight)`	constructs an edge between vertices `v` and `w` of the given `weight`
`int either()`	returns one endpoint of this edge
`int other(int v)`	returns the endpoint of this edge that is different from vertex `v`
`double weight()`	returns the weight of this edge
`String toString()`	returns a string representation of this edge
`int compareTo(Edge other)`	returns a comparison of this edge with `other` by their weights

EdgeWeightedGraph	
`EdgeWeightedGraph(int V)`	constructs an empty edge-weighted graph with `V` vertices and 0 edges
`EdgeWeightedGraph(In in)`	constructs an edge-weighted graph from the input stream `in`
`int V()`	returns the number of vertices in this edge-weighted graph
`int E()`	returns the number of edges in this edge-weighted graph
`void addEdge(Edge e)`	adds an edge `e` to this edge-weighted graph
`Iterable<Integer> adj(int v)`	returns the edges incident on vertex `v` in this edge-weighted graph
`int degree(int v)`	returns the degree of vertex `v` in this edge-weighted graph
`Iterable<Edge> edges()`	returns all the edges in this edge-weighted graph
`String toString()`	returns a string representation of this edge-weighted graph

Kruskal	
`Kruskal(EdgeWeightedGraph G)`	determines the minimum spanning tree (MST) of the edge-weighted graph `G`
`Iterable<Edge> edges()`	returns the edges in the MST
`double weight()`	returns the sum of the edge weights in the MST

DiEdge	
`DiEdge(int v, int w, double weight)`	constructs a directed edge from vertex `v` to vertex `w` of the given `weight`
`int from()`	returns the tail vertex of this directed edge
`int to()`	returns the head vertex of this directed edge
`double weight()`	returns the weight of this directed edge
`String toString()`	returns a string representation of this directed edge

EdgeWeightedDiGraph	
`EdgeWeightedDiGraph(int V)`	constructs an empty edge-weighted digraph with `V` vertices and 0 edges
`EdgeWeightedDiGraph(In in)`	constructs an edge-weighted digraph from the input stream `in`
`int V()`	returns the number of vertices in this edge-weighted digraph
`int E()`	returns the number of edges in this edge-weighted digraph
`void addEdge(DiEdge e)`	adds a directed edge `e` to this edge-weighted digraph
`Iterable<Integer> adj(int v)`	returns the directed edges incident from vertex `v` in this edge-weighted digraph
`int outDegree(int v)`	returns the out-degree of vertex `v` in this edge-weighted digraph
`int inDegree(int v)`	returns the in-degree of vertex `v` in this edge-weighted digraph
`Iterable<DiEdge> edges()`	returns all the directed edges in this edge-weighted digraph
`String toString()`	returns a string representation of this edge-weighted digraph

Dijkstra implements Paths	
`Dijkstra(DiGraph G, int s)`	determines the shortest paths from the source vertex `s` to every other vertex in the edge-weighted digraph `G`

Strings

Alphabet	
`static Alphabet BINARY`	the binary alphabet $\{0, 1\}$
`static Alphabet OCTAL`	the octal alphabet $\{0, 1, 2, 3, 4, 5, 6, 7\}$
`static Alphabet DECIMAL`	the decimal alphabet $\{0, 1, 2, 3, 4, 5, 6, 7, 8, 9\}$
`static Alphabet HEXADECIMAL`	the hexadecimal alphabet $\{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F\}$
`static Alphabet DNA`	the DNA alphabet $\{A, C, G, T\}$
`static Alphabet LOWERCASE`	the lowercase alphabet $\{a, b, c, \ldots, z\}$
`static Alphabet UPPERCASE`	the uppercase alphabet $\{A, B, C, \ldots, Z\}$
`static Alphabet PROTEIN`	the protein alphabet $\{A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W, Y\}$
`static Alphabet BASE64`	the base-64 alphabet (64 characters)
`static Alphabet ASCII`	the ASCII alphabet $(0 - 127)$
`static Alphabet EXTENDED_ASCII`	the extended ASCII alphabet $(0 - 255)$
`static Alphabet UNICODE16`	the Unicode 16 alphabet $(0 - 65,535)$
`Alphabet()`	constructs a new alphabet using characters 0 through 255
`Alphabet(int radix)`	constructs a new alphabet using characters 0 through `radix` - 1
`Alphabet(String s)`	constructs a new alphabet from the string of characters `s`
`boolean contains(char c)`	returns `true` if `c` is a character in this alphabet, and `false` otherwise
`int radix()`	returns the radix of this alphabet
`int lgRadix()`	returns the binary logarithm (rounded up) of this alphabet's radix
`int toIndex(char c)`	returns the index of `c`
`int[] toIndices(String s)`	returns the indices of the characters in `s`
`char toChar(int index)`	returns the character with the given index
`String toChars(int[] indices)`	returns the characters with the given indices

LSD

`static void sort(String[] a)`	sorts the array `a` of fixed-length strings over the extended ASCII alphabet

MSD

`static void sort(String[] a)`	sorts the array `a` of strings over the extended ASCII alphabet

TrieST

`TrieST()`	constructs an empty symbol table
`boolean isEmpty()`	returns `true` if this symbol table is empty, and `false` otherwise
`int size()`	returns the number of key-value pairs in this symbol table
`void put(String key, Value value)`	inserts the `key` and `value` pair into this symbol table
`Value get(String key)`	returns the value associated with `key` in this symbol table, or `null`
`boolean contains(String key)`	returns `true` if this symbol table contains `key`, and `false` otherwise
`void delete(String key)`	deletes `key` and the associated value from this symbol table
`Iterable<String> keys()`	returns all the keys in this symbol table
`Iterable<String> keysWithPrefix(String prefix)`	returns all the keys in this symbol table that start with `prefix`
`Iterable<String> keysThatMatch(String pattern)`	returns all the keys in this symbol table that match `pattern`, where the . symbol is treated as a wildcard character
`Iterable<String> longestPrefixOf(String query)`	returns the string in this symbol table that is the longest prefix of `query`, or `null`
`String toString()`	returns a string representation of this symbol table

KMP

`KMP(String pattern, int radix)`	preprocesses the `pattern` string with alphabet size given by `radix`
`int search(String text)`	returns the index of the first occurrence of the pattern string within the `text` string, or the length of the text string

NFA

`NFA(String regexp)`	constructs a nondeterministic finite state automaton (NFA) from `regexp`
`boolean recognizes(String text)`	returns `true` this NFA recognizes `text`, and `false` otherwise

Genome

`static void compress()`	reads from standard input a sequence characters over the alphabet $\{A, C, G, T\}$; compresses them using two bits per character; and writes the results to standard output
`static void expand()`	reads from standard input a sequence of genome-compressed bits; expands each two bits into a character over the alphabet $\{A, C, G, T\}$; and writes the results to standard output

RunLength

`static void compress()`	reads from standard input a sequence of bits; compresses them using run-length coding with 8-bit run lengths; and writes the results to standard output
`static void expand()`	reads from standard input a sequence of runlength-compressed bits; expands them; and writes the results to standard output

Huffman	
`static void compress()`	reads from standard input a sequence of bytes; compresses them using Huffman codes with an 8-bit alphabet; and writes the results to standard output
`static void expand()`	reads from standard input a sequence of Huffman-compressed bits; expands them; and writes the results to standard output
