

XHTML

Instructor: Wei Ding

# What is XHTML?

- XHTML stands for **EXtensible HyperText Markup Language**
- XHTML is aimed to **replace** HTML
- XHTML is almost **identical** to HTML 4.01
- XHTML is a **stricter and cleaner** version of HTML
- XHTML is HTML defined as an **XML application**
- XHTML is a **Web Standard**: XHTML 1.0 became an official W3C Recommendation January 26, 2000.

# Why XHTML?

- XHTML is a **combination** of HTML and XML.
- XHTML consists of all the elements in **HTML 4.01** combined with the syntax of **XML**.
- XHTML results in “**well-formed**” documents, which work in all browsers and are backward browser compatible.
- XHTML pages can be read by all **XML enabled device**.
- XHTML is a language that is useful **now** and in the **future**.

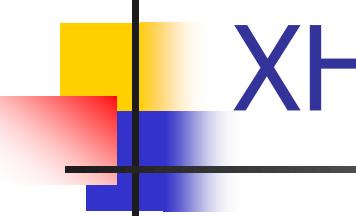

# Differences Between XHTML and HTML

- XHTML elements must be **properly nested**
  - ~~<b><i>bad: This text is bold and italic</b></i>~~
  - <b><i>good: This text is bold and italic</i></b>
- XHTML documents must be **well-formed**
  - All XHTML elements must be nested within the `<html>` root element.  
All other elements can have sub (children) elements. Sub elements must be in pairs and correctly nested within their parent element.

```
<html>
  <head> ... </head>
  <body> ... </body></html>
```
- Tag names must be in **lowercase**
- All XHTML elements must be **closed**
  - Empty Elements Must also Be Closed: `<br />`, `<hr />`, ``

An extra space before /

# XHTML Syntax

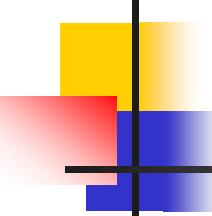

- Writing XHTML demands a clean HTML syntax.
- Attribute names must be in **lower case**
- Attribute values must be **quoted**
- Attribute minimization is **forbidden**:
  - ~~<option selected>~~
  - <option selected="selected">
- The id attribute **replaces** the name attribute
  - HTML 4.01 defines a name attribute for the elements a, applet, frame, iframe, img, and map. In XHTML the name attribute is deprecated. Use id instead.

# XHTML Syntax: The Lang Attribute

- The lang attribute applies to almost every XHTML element. It specifies the language of the content within an element.
- If you use the lang attribute in an element, you must add the xml:lang attribute, like this:

```
<div lang="no" xml:lang="no">Heia  
Norge!</div>
```

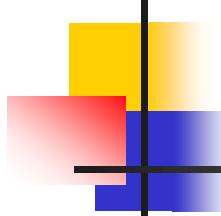

NORWAY

# XHTML Syntax

- The XHTML DTD defines **mandatory** elements
- The XHTML standard defines three Document Type Definitions: Strict, Transitional, and Frameset.
  - The most common is the XHTML **Transitional**.
- The **DOCTYPE** declaration should always be the **first** line in an XHTML document. The basic document structure is:

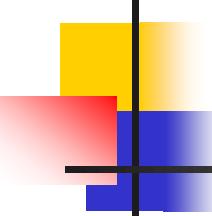

```
<!DOCTYPE ...>
<html xmlns="http://www.w3.org/1999/xhtml">
<head><title>... </title></head>
<body> ... </body></html>
```

# XHTML 1.0 Strict

- Use this when you want really clean markup, free of presentational clutter. Use this together with Cascading Style Sheets.

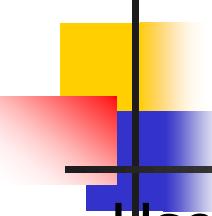

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"  
      "http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">  
<html xmlns="http://www.w3.org/1999/xhtml">  
  <head>  
    <title>Conforming XHTML 1.0 Strict Template</title>  
  </head>  
  <body>  
  </body>  
</html>
```

# XHTML 1.0 Transitional

- Use this when you need to take advantage of HTML's presentational features and when you want to support browsers that don't understand Cascading Style Sheets.

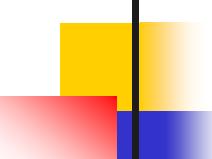

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"  
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">  
<html xmlns="http://www.w3.org/1999/xhtml">  
<head>  
<title>Conforming XHTML 1.0 Transitional Template</title>  
</head>  
<body>  
</body>  
</html>
```

# XHTML 1.0 Frameset

- Use this when you want to use HTML Frames to partition the browser window into two or more frames.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Frameset//EN"  
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-frameset.dtd">  
<html xmlns="http://www.w3.org/1999/xhtml">  
<head>  
<title>Conforming XHTML 1.0 Frameset Template with accessibility</title>  
</head>  
<frameset>  
<noframes>  
<body>  
<!-- place alternative information for accessibility purposes here -->  
</body>  
</noframes>  
</frameset>  
</html>
```

# XHTML Validation

- An XHTML document is validated against a Document Type Definition (DTD). Before an XHTML file can be properly validated, a correct DTD must be added as the first line of the file.
- The **Strict DTD** includes elements and attributes that have not been deprecated or do not appear in framesets:

```
!DOCTYPE html PUBLIC
```

```
"-//W3C//DTD XHTML 1.0 Strict//EN"
```

```
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd"
```

- The **Transitional DTD** includes everything in the strict DTD plus deprecated elements and attributes:

```
!DOCTYPE html PUBLIC  
"-//W3C//DTD XHTML 1.0 Transitional//EN"  
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd"
```
- The **Frameset DTD** includes everything in the transitional DTD plus frames as well:

```
!DOCTYPE html PUBLIC  
"-//W3C//DTD XHTML 1.0 Frameset//EN"  
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-frameset.dtd"
```

# XHTML 1.0 Strict Validation

```
<!DOCTYPE html
PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>XHTML 1.0 Validation Template</title>
<meta http-equiv="Content-Type" content="text/html; charset=ISO-8859-1" />
</head>
<body>
<p>
<a href="http://validator.w3.org/check/referer">
</a>
</p>
</body>
</html>
```
